Week 3

Creativity, Teamwork and Problem-Solving Techniques in Project Management

What will you learn today

- Today is not about the PM Process but what goes into it like Creativity, Teamwork, and Problem-Solving. There are multitude of Techniques to encourage those in Project Management. You will learn some of them today and tomorrow including:
 - Ideation
 - Assumption Busting
 - Pre-Mortem
 - Non-linear thinking
 - Post-Mortem

Source: Lock, D. (2018). *Project management*.p10

The Context: The Evolution of Project Management

TABLE 2-2 Executive View of Project Management

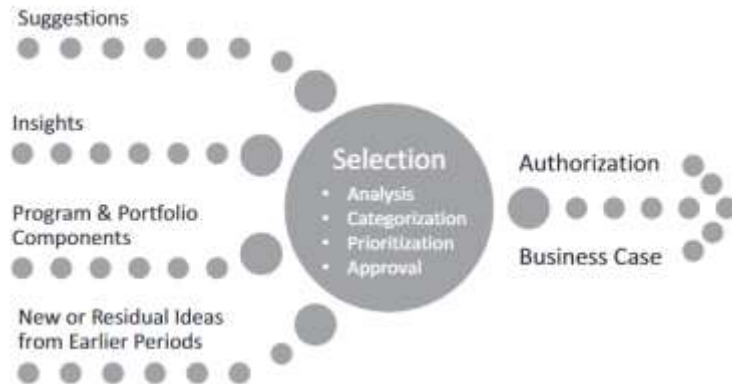

PM 1.0	PM 2.0
Project management should be considered as a career path position	Project management is a strategic or core competency necessary for the survival of the firm
We need people certified in project management	We need people certified in both project management and business processes
Project managers are used for project execution or delivery only	Project managers should be involved in project identification, project selection, portfolio management, and capacity-planning activities
Strategy and execution are separate activities	Project managers are the people who bridge strategy and execution

Source: Kerzner, H. (2015). *Project management 2.0 : leveraging tools, distributed collaboration, and metrics for project success* (1st ed..).

What is Ideation?

[What is Ideation? | IxDF](#)

Wu (2020) says that ideation is the first step in the project life cycle. However, Vedsmand (2013) states that ideation should be present throughout the project life cycle, not only at the beginning. In Design Thinking Ideation is 3rd step of the Process after Emphasising and Defining.

(Wu, 2020)

Heising (2012) says 'effective management of single projects is no longer sufficient. In today's business market, proactive management of the whole project portfolio has become increasingly important for achieving long-term success and competitive advantage. At the front end of projects, opportunities are discovered, ideas are created, and the foundation for later project, portfolio, and, eventually, corporate success is laid'

Simply speaking, it is an idea generation stage of the Project Management process. Ideation should come after a thorough research on the topic of the project and include a diverse team that know the subject/issue/product from different perspectives.

Customer/Stakeholder Pain Points /Scoping

Idea generation should be done without judgment. Its purpose is to produce as many ideas as possible, which can later be evaluated, combined, or refined to solve a specific challenge.

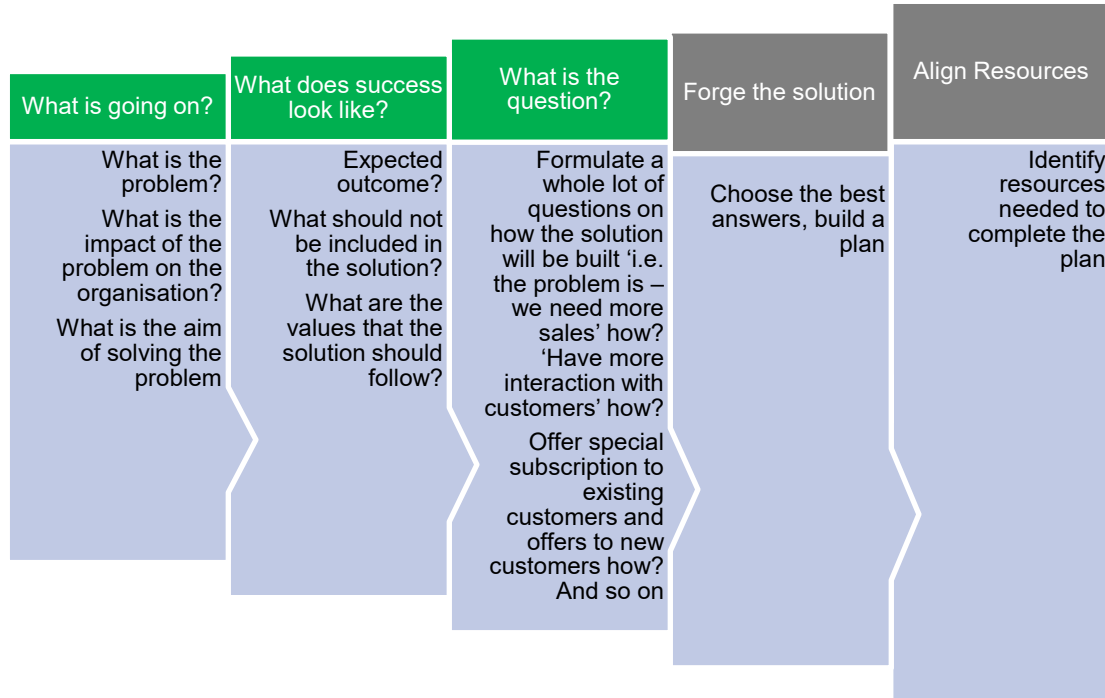

Objective:

- Identify the problem
- make a clear problem statement
- then establish a clear goal to achieve
- In a business environment, you will need market or customer data, you also might need to speak to customers or other stakeholders to solidify the problem or the ambition.

Example of a customer problem for a mobile phone company:

Identifying the Problem Hurson's Productive Thinking Model – the first 3 stages are about ideation

Rapid Ideation

Rapid Ideation

In rapid ideation, everyone writes down as many ideas as possible in a set amount of time before any ideas are discussed, critiqued, or fleshed out. For this brainstorming technique, you will need to set (and stick to) a time constraint, otherwise you'll risk losing the sense of urgency.

This brainstorming exercise can be helpful to avoid the all-too-common scenario when an idea is shot down before it has time to grow, transform, and develop.

By allowing everyone to capture their ideas before the critique begins, rapid ideation avoids the inevitable, premature shooting down of ideas. The time constraint can also prevent people from talking themselves out of an idea before they share it with a group—a common brainstorming mishap.

Other Types of Brainstorming

<https://youtu.be/JZohTZWQLSY>

- **Brainwriting:** Instead of shouting out ideas and having a facilitator write them down, this creative thinking technique involves passing around a paper or digital document and having each team member write down their own ideas — including ideas they might be embarrassed to share aloud in front of the whole team. Alternatively, instead of moving the paper about, you can move people about who then stick post it notes on a board/wall
- **Round robin:** The round-robin creative technique is similar to brainwriting, except that each time the document is passed around, the next team member adds their feedback, resulting in a range of different perspectives.
- **Reverse brainstorming:** Reverse brainstorming flips the script. Instead of trying to think of great ideas, consider things that would make the situation worse. This can help to identify the root cause of a troublesome problem.
- **Bubbles** help organize and visualise related ideas around a central concept, making it easier to brainstorm, analyse relationships, and enhance critical thinking.
- **Grids** – building on previously provided ideas
- **Mind mapping** - similar to grids, you add ideas on the board, piece of papers to the previous ideas

Ideation : SCAMPER

The SCAMPER technique

Substitute This involves replacing part of the product, service, or process with something else to see if it improves or changes the outcome. Ask yourself: What can I substitute to make this product or service better? Can I use different materials, people, or processes?

Example: If you're designing a new coffee cup, you might consider substituting plastic for a more sustainable material like bamboo or glass.

Combine This step encourages combining different elements or ideas to create something new. Look for ways to merge two or more concepts into one. What can I combine to improve this product or service? Can I merge different features to create a more valuable experience?

Example: Combining a fitness tracker with a smartwatch to provide a more comprehensive health-monitoring solution, combining communication and activity tracking in one device.

Adapt think about how you can adapt something from another industry or situation to fit your current context. Ask: What can I adapt from other products or industries to solve this problem? How can I take an existing solution and make it work in a new context?

Example: If you're working on a new retail app, you might adapt the success of a gaming app's reward system to encourage more user engagement.

Modify This involves changing or modifying an element of the product or process to enhance its appeal or functionality.

How can I modify or exaggerate parts of this to make it more effective? Can I increase the size, speed, or features of this to improve it?

Example:

You could modify a standard water bottle by adding a built-in filtration system, turning it into a more useful product for people who are always on the go.

Eliminate This involves removing unnecessary parts or features to simplify the product or service. Think about:

What can I eliminate without affecting the value of the product?

Is there anything superfluous or redundant that can be removed to improve efficiency or usability?

Example: For a software application, you might eliminate unnecessary steps in the user interface to make it more intuitive and user-friendly.

Reverse This step encourages you to consider the opposite or reverse of what is currently being done. Ask:

What happens if I reverse the process or sequence of operations? Can I think about the problem in reverse to find a new solution?

Example: If you're designing a website, instead of a typical "shop now" button, you could have a "design your product" button first, where customers customize their items before purchasing, reversing the usual flow

The Sleeping Beauty SCAMPER -20mins

Why is it always about Princesses being all beautiful, gullible and a good girl without a vice and why are Princes good-looking and brave?
Why do the Princesses always have to be 'rescued' by the male protagonists?
Why is getting married and living ever after together so appealing?

The heck with that!

Work in Groups of 4 and use **SCAMPER** to reinvent the Story to make it more contemporary and interesting to a modern audience (normally you would first scope requirements of course) ! A summary of the traditional fairy tale will be distributed.

You have 20mins prep time and then tell us your new SCAMPER based story

30 mins brain break

Practice Ideation- 40mins

Objective

Your team is tasked with developing a **Smart Home Thermostat**. The product needs to be innovative and must address various customer pain points. Customers are increasingly interested in smart home products, but there are significant frustrations with existing solutions. The goal is to **improve the existing solution** based on the key pain points that customers experience with current offerings.

The 4 types of customer pain points

Process: Setting up and programming the thermostat can be complicated, especially for users who are not tech-savvy. Many smart thermostats require linking to multiple apps.

Financial: The upfront cost of smart thermostats can be high, and many consumers struggle to justify the expense when traditional thermostats are cheaper.

Support: When customers experience issues with the smart thermostat (e.g., connectivity problems, faulty temperature readings), support is often slow and not very helpful. In some cases, users can't find troubleshooting information easily

Product: Many smart thermostats are not highly customizable or sensitive to real-time changes in temperature preferences

What you need to do: Divide into Groups of 4. As a group, choose 1 Customer Pain Point you want to work with – 3mins.

Step 1: Individually, write as many ideas as you can in 5mins – 1 idea per post it note. Stick all your post it notes on the table.

Step 2: Read all the ideas on the table – 5mins. **Step 3** Take all the ideas one by one; the owner of the idea explains it briefly and then the team allocate the idea according on the agreed Impact vs Effort Matrix – 15mins **Step 4:** As a team, based on the matrix, choose 1 main idea you want to work on – each team member writes another idea that expands on the main idea (refines it, defines it better, develops it, makes it more practical) – 5mins. **Step 5** Present your outcomes

Homework for Tomorrow

- Astra Zeneca and Marriot Case Studies

5 mins brain break

Let's play - Reverse Ideation

Turning a Bad idea into a Good one 😊 30mins

- Split into 3 groups
- Use the reverse-brainstorming method to find a bad idea for a product
- Identify the qualities of this product that make it a bad idea
- What other good product ideas share those qualities?
- What is good about your bad idea? In what context would it be good?
- How can you overcome the badness of the idea without fixing the product 'bad' characteristics
- Did you succeed?

5 mins brain break

The Witches of Glum

Are you wondering what the Witches of Glum have to do with today's session?

It is to draw your attention to the fact that we make assumptions based on preconceptions and heuristics (mental shortcuts) every day, we do it in business believing that our preconceptions are true. Whilst assumptions can be very useful and help us navigate in the world quickly, they can be a huge pitfall when make assumptions during the project. Thus, testing, testing, testing is very important for the project success.

Yesterday from LinkedIn

Validating Assumptions – a Crucial Phase of the Project Risk Management

TABLE 6-1 Assumption Validation Checklist

Checklist for Validating Assumptions	Yes	No
Assumption is outside of the control of the project		
Assumption is outside of the control of the stakeholders		
The assumption can be validated as correct		
Changes in the assumption can be controlled		
The assumed condition is not fatal		
The probability of the assumption holding true is clear		
The consequences of this assumption pose a serious risk to the project		
Unfavorable changes in the assumption can be fatal to the project		

Easier said than done, why?

'Throughout the project, the project manager must revalidate and challenge the assumptions. Changing assumptions may mandate that the project be terminated or redirected toward a different set of objectives.' (Kerzner, 2015 p.122)

Source: Kerzner, H. (2015). *Project management 2.0 : leveraging tools, distributed collaboration, and metrics for project success* (1st ed..).

Assumption Busting

Examples of Typical Assumptions:

- That it is impossible to do something--particularly within constraints such as time and cost.
- That something works because of certain rules or conditions.
- That people believe, think or need certain things.
- That more is better i.e. information leads to better decisions, bigger budgets will lead to growth
- That what worked before will work again
- That failure is always negative
- That People can multitask effectively

Assumption Busting:

is a questioning process that helps identify and eliminate preconceptions or blind spots that hold people back from proposing or pursuing the best solution.

A valuable tool that is used in **problem-solving, decision-making, and innovation**, and it can be applied in a wide range of settings, from business and industry to government and nonprofit organisations.

For example; I might assume that deliveries have to take a minimum of three days and that customers understand that, and it is no problem for them. Or that the cost of borrowing money will remain stable for the duration of the project, or the marketplace wants the product we are designing, or that we have the resources needed for the project etc., etc., etc.

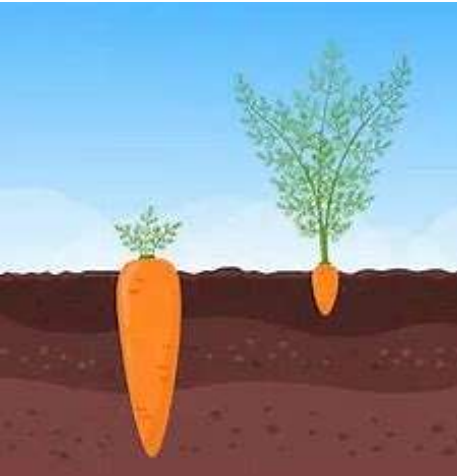

Innovation Supporting Techniques- Assumption Busting - 10mins

Other questioning techniques

- Devil's advocate or Constructive Trouble Making
- Reverse thinking
- What if...
- Empathy mapping/ customer chair
- Deconstruction – to check whether the meaning is superficial or does it hold up
- How do you know...

Assumption: We need more customer service staff

Questions: **What if** we did the opposite and removed CSRs, how could we cope? RT/CTM
What problem are we tackling through more headcount? Deconstr.
What are **other ways** to improve XX without more staff? Deconstr.
How do you know the problem is truly due to a lack of staff, or could it be related to other factors (e.g., training gaps, inefficient processes, old technology, or ineffective communication)? Deconstr./HDYK/CTM
Is this need based on customer feedback? Customer chair/HDYK
What is our current response time vs market standards? HDYK
How do our customers experience this service? Customer chair / HDYK
What are our CS customer's needs and how do we score against them?
Customer chair

Now you try...Assumption Busting - 10

Below are some common phrases and idioms that the society have created as 'true'. In Pairs, Choose 2 of the below and use the earlier mentioned questioning techniques in the attempt to bust them. Research on the web examples from the business that show the contrary.

- 'Time heals all wounds'
- 'You should always trust your gut'
- 'Hard work always pays off'
- 'The customer is always right'
- 'Money can't buy happiness'
- 'You need to go to college to be successful'
- 'Social Media has a negative effect on mental health'
- 'Boys will be boys'
- 'AI will replace Human jobs in 10 years'

Project Pre-Mortem

In relation to the risk factors Pre-Mortem and Post-Mortem ask similar questions. Pre-Mortem tries to foresee them, Post-Mortem tries identify lessons-learnt and plan improvement for the next iteration stage i.e. product or feature or next project

Pre-Mortem example process

Pre-Mortem Template

What was the Desired Outcome of this Idea/Project/Product?

How would we know if we succeeded?

- 1.
- 2.
- 3.

Imagine that you are 10 weeks 2 after the product release/feature upgrade etc. and it has spicily failed. What happened?

Failure (Project for the worst-case scenario)

Examples:

Our key assumptions are proven wrong

Our Tech didn't work

The customer(s) is unhappy, why?

We underestimated ____

We overestimated ____

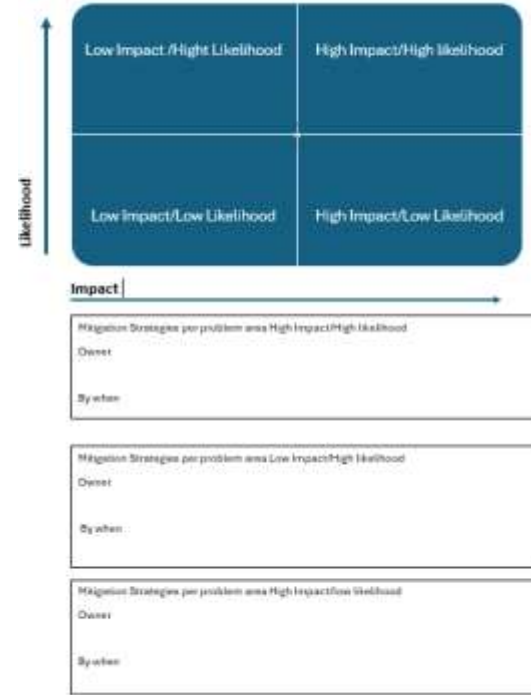

We went over budget, why?

Key team members have left, why?

We didn't take ____ into account (1000000000)

We missed the deadline

What Consequence would we need to deal with?

Pre-mortem and 5Whys – Example

Pre-mortem for a new Coffee Shop

Why 1: Why might the coffee shop fail after launch?

Answer: The coffee shop attracts fewer customers than expected, and sales are lower than projected.

Why 2: Why are sales lower than expected?

Answer: Despite strong foot traffic in the area, the shop has fewer repeat customers, and initial sales seem to plateau after the first few weeks.

Why 3: Why are there fewer repeat customers?

Answer: Customers don't feel compelled to return regularly. They don't seem to be developing a connection with the shop.

Why 4: Why don't customers feel compelled to return regularly?

Answer: While the coffee quality is high, the experience doesn't feel special or unique. The shop doesn't offer anything beyond the basic product, and it doesn't stand out from other coffee shops in the area.

Why 5: Why doesn't the shop offer a unique experience that encourages repeat visits?

Answer: The team focused on perfecting the product and location but didn't prioritise creating an engaging atmosphere, developing customer loyalty programs, or integrating other aspects like community engagement or a memorable experience.

Mitigation Strategies – Back to ideation

Pre-Mortem Activity – 20mins + presentation

Launching a New Virtual Reality (VR) Escape Room Experience

Background: You are part of a team working to create a cutting-edge Virtual Reality (VR) escape room experience for entertainment. The project is being developed by a small start-up that specialises in immersive technologies, and your target market is primarily young adults and tech enthusiasts. The VR escape room is designed to be played from home using affordable VR headsets. The idea is to offer players an exciting and immersive experience where they can solve puzzles, explore different environments, and interact with other players in real-time.

Your team has been given 6 months to develop, test, and launch the first VR escape room. The game will feature a story-driven narrative, multiple levels of puzzles, and an online multiplayer mode where friends can play together.

Split into 3 teams and play a Pre-Mortem for this scenario. You can use the 5 whys exercise, or the template provided.

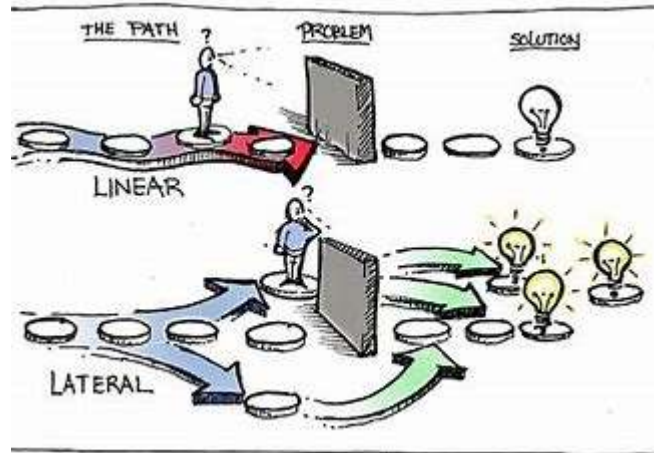

Identify **3 different potential failures** that would fall in the High Impact/High probability or/and High Impact/Low Probability or/and Low Impact/High probability categories

Identify **1 mitigation strategy** for each problem

Non-linear or Lateral Thinking

- What is it?

From Linear to Lateral: Unleashing the Power of Non-Traditional Thinking

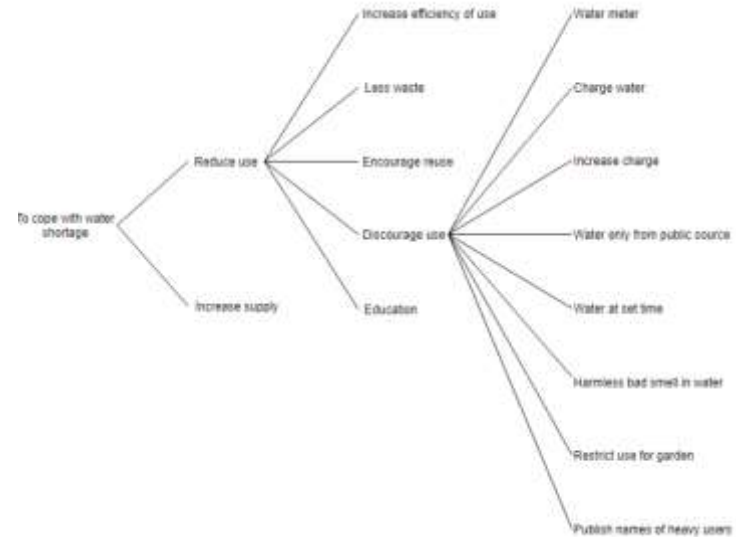

Non-linear or Lateral Thinking

The term coined by De Bono in late 90s in his book 'Lateral Thinking'. Some techniques he introduced:

Random Entry: Introducing random words to inspire new ideas. Example: *Balloon: Lightness, fun, floating, movement, colour, air, space*. The idea is not to directly solve the problem using the **random** word, but to use it to help your mind begin thinking in new directions.

Provocation: Making provocative statements that challenge assumptions and open up new directions. i.e. *What if we removed all the books from the bookstore, how would we cope?*

Concept Fan: Expanding thinking by exploring different possibilities and angles from the same starting point. Example: opposite

Source: De Bono, 1992

Practice the Non-Linear thinking – 10mins

- Split into 3 Groups
- Each group will take a different Technique: Random Entry, Provocation, Concept Fan
- Use the new coffee shop scenario to practice those 3 techniques and present to the Group

For Example: **Random Entry**

Brainstorm at least 2 random associations with a Coffee Shop i.e. **Smell** and then describe the coffee shop smell with different adjectives i.e. relax, time out, energy. Once you have at least 5 associations, deliberate which of the words could be transformed into a Unique Selling Points for the coffee shop. Alternatively, you can just choose a completely random word and see what happens.

Provocation: Make at least 2 suggestions that may sound ridiculous like removing all the chairs from the coffee shop – how would you overcome this with a different solution?

Concept Fan: i.e. how to attract customers to return regularly: find different ideas, choose one and branch it out onto other solutions, choose one and branch it out again with more solutions until you struggle to branch it out again

5 mins brain break

Post-Mortem

The purpose of a post-mortem is to evaluate de-railers and problems encountered during the project, so that they can be considered next time.

Post-Mortem is done at any point of the project. It can be done once it is complete or at a significant milestone

This is a positive exercise to increase our chances of delivering against our vision of success next time

Post-Mortem - Red and Blue Pill context

The red pill, together with its opposite, the blue pill, is a metaphor representing a choice between the "red pill", representing a life of harsh knowledge, desperate freedom, and the brutal truths of reality, and the "blue pill", representing a life of luxurious security, tranquil happiness, and the blissful ignorance of the harsh realities of life, basking in an (essentially dishonest) illusion.

The terms, popularised in science fiction culture, are directly derived from a scene in the 1999 film *The Matrix*.

Part 1 – Take the Pill (20 minutes)

Red Pill

Unrecognised Risk

- List what went wrong and wasn't anticipated to go wrong?
- Assumptions that were left untested
- Warning signs ignored
- Rare events that weren't regarded as likely
- Dependencies that weren't considered
- Etc.

Blue Pill

Unrecognised Opportunity

- List all the ways the project was successful
- How we exceeded expectations
- How we worked differently internally and with key partners
- How we learnt new things
- How we grew stronger as a team
- Don't limit yourself
- Etc.

- 2 teams
- Step 1 - Individually list using post-it notes (10 minutes)
- Step 2 - In your sub-team discuss, consolidate and add to their post-its (10 minutes)

Part 2 – Question (30 mins)

- One person from each team de-briefs the whole group
- Challenge each team's outputs to deepen the understanding of assumptions, risks and root causes. (15 mins per team)
- Objective is to create a list we all understand to prioritise and build countermeasures
 - Suggested questions include:

Red Pill - Unrecognised Risk

- What happened to cause that?
- Why did nobody do anything to prevent that?
- Why didn't we see that coming?
- Who owned that?
- What would we need to change in our mindset to prevent that?

Blue Pill - Unrecognised Opportunity

- What shifted in our mindset to make that possible?
- How did we need to work differently with our partners / customers / competitors / leaders / colleagues / other sites?
- Why aren't we more ambitious?
- Why don't we go 10x faster?

Part 3 – Vote (10 mins)

Each person has 10 votes:

- 5 to choose the biggest priorities they feel will de-rail the project again if left unchanged
- 5 on the biggest opportunities currently not being seized to make it better
- You can put 2 votes on one issue if you feel it is particularly problematic or high in potential opportunity

Part 4 – Plan (25 mins)

The 2 teams work separately on developing plans/activity for preventing future disasters
and seizing the opportunities for success in the future / next project/ next phase of the project

- Focus on the top voted risks and opportunities
- Capture specific, measurable actions

Number	What?
	<i>Actions captured by facilitator</i>

Part 5 - Share, assign and capture actions (45 mins)

- As a whole group discuss the plans/activity for each top-voted risk and opportunity
- Agree specific measurable actions for each
 - Agree an owner for each action
- Discuss how these risks, opportunities and plans affect the existing project plan

Number	What?	Who?	When?
	<i>Actions captured by facilitator</i>		

Practice Postmortem -20 mins + Presentation

Red Pill

Unrecognised Risk

- List what went wrong and wasn't anticipated to go wrong?
- Assumptions that were left untested
- Warning signs ignored
- Rare events that weren't regarded as likely
- Dependencies that weren't considered
- Etc.

Blue Pill

Unrecognised Opportunity

- List all the ways the project was successful
- How we exceeded expectations
- How we worked differently internally and with key partners
- How we learnt new things
- How we grew stronger as a team
- Don't limit yourself
- Etc.

Split into 2 teams: each team will take a different case study Marriott or Astra Zeneca
Each team will split again into 2 teams: the Red Pill Team and the Blue Pill Team
Each sub-team to analyse the Case Study and agree on 3 main lessons learnt from the Blue and Red Pill Perspective. Then the whole team moves to work on the recommendations of actions for the future, to make future projects even more successful, quick and efficient.

The Six Thinking Hats – The rest of the sessions

What is it for?

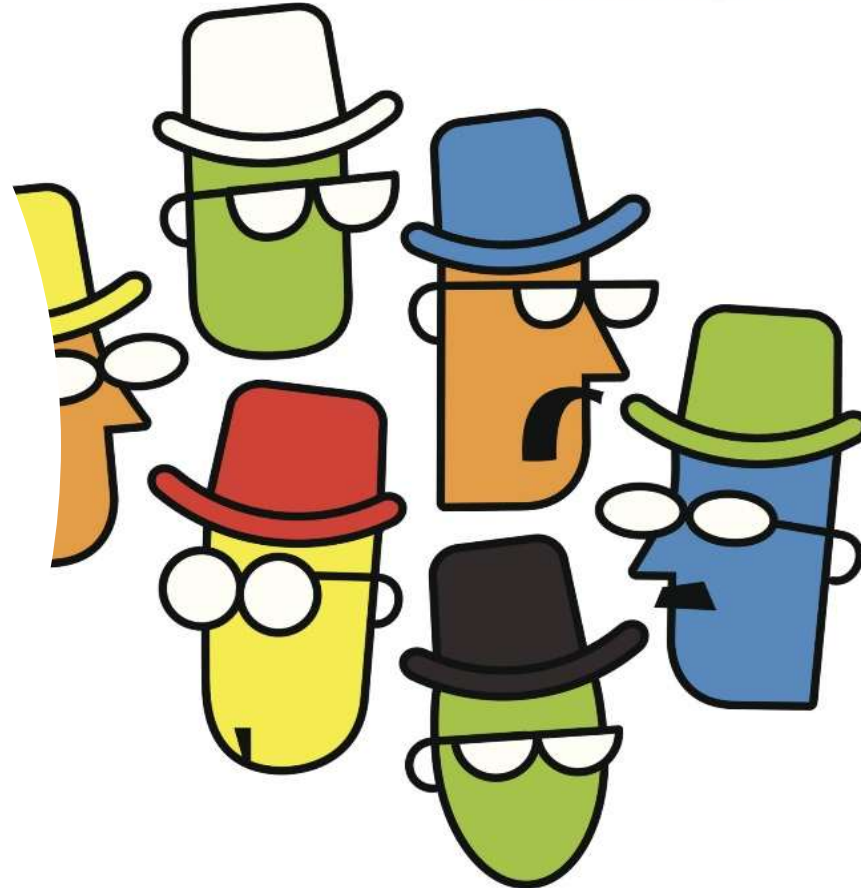

Thinking differently, namely outside of your normal preference, when brainstorming in order to generate ideas.

‘To help group discussions and promote a more effective decision making’ (De Bono, 2017)

It is used to **switch** thinking depending on the situation.

It turns thinking into a game and legitimises the use of different types of thinking by asking for different hats e.g. "We've had a lot of blue thinking; how about some red hat thinking now?"

It reduces the risk of more vocal participants monopolising the thinking style

The Six Thinking Hats... their meaning

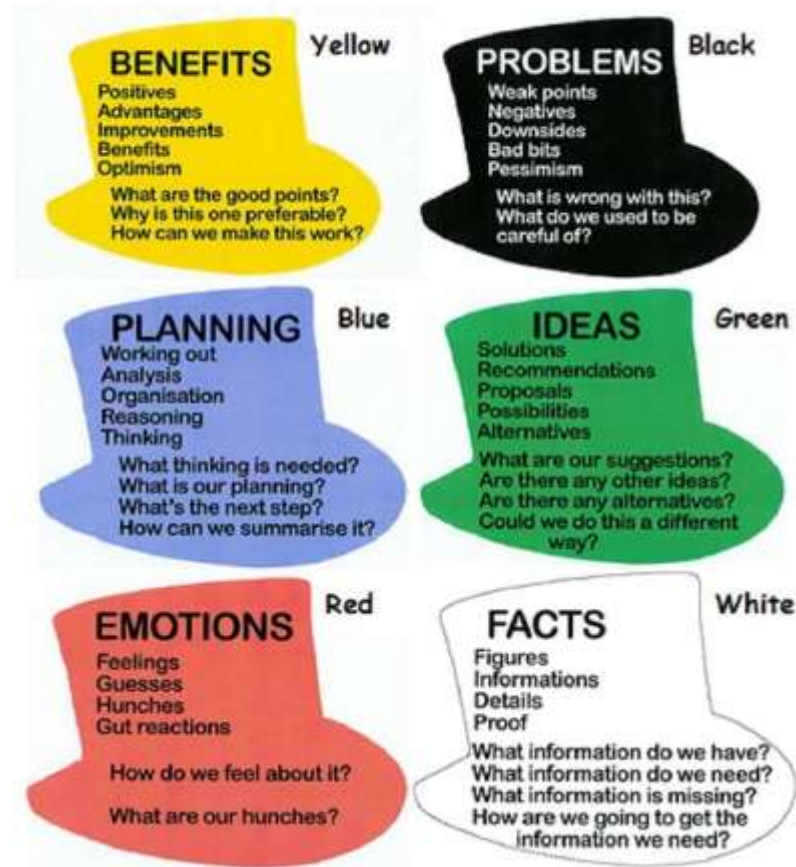

Source: Edward de Bono: Six Thinking Hats

1. **White Hat: data** This is about data and information. What information do we already have? What are we missing? What would we like to have? How can we get it?
2. **Red Hat: hunches** This is about feelings, hunches and intuitions. There should be no apologies about this. You just state your feelings about a subject based on your experience of dealing with that subject.
3. **Black Hat: analysis** This hat is about caution, prevention and expert judgement. It is the most natural of the hats and protects the group from mistakes. It can be dangerous if overused since it may stifle discussion.
4. **Yellow Hat: optimism** This hat is about optimism and being positive. It looks at feasibility and benefits and what is possible. This is usually not a natural hat and requires deliberate effort.
5. **Green Hat: creativity** This hat is about creativity, new ideas and alternatives. It involves provocation and movement from the start position i.e. 'coffee can only be consumed in a liquid form'
6. **Blue Hat: process** This hat is about overviews, process and agenda. This hat coordinates the other hats and as such is usually worn by the chairperson. It often helps to understand why we are here and how we are going to get there

What questions would we be asking during a creative process/problem solving?

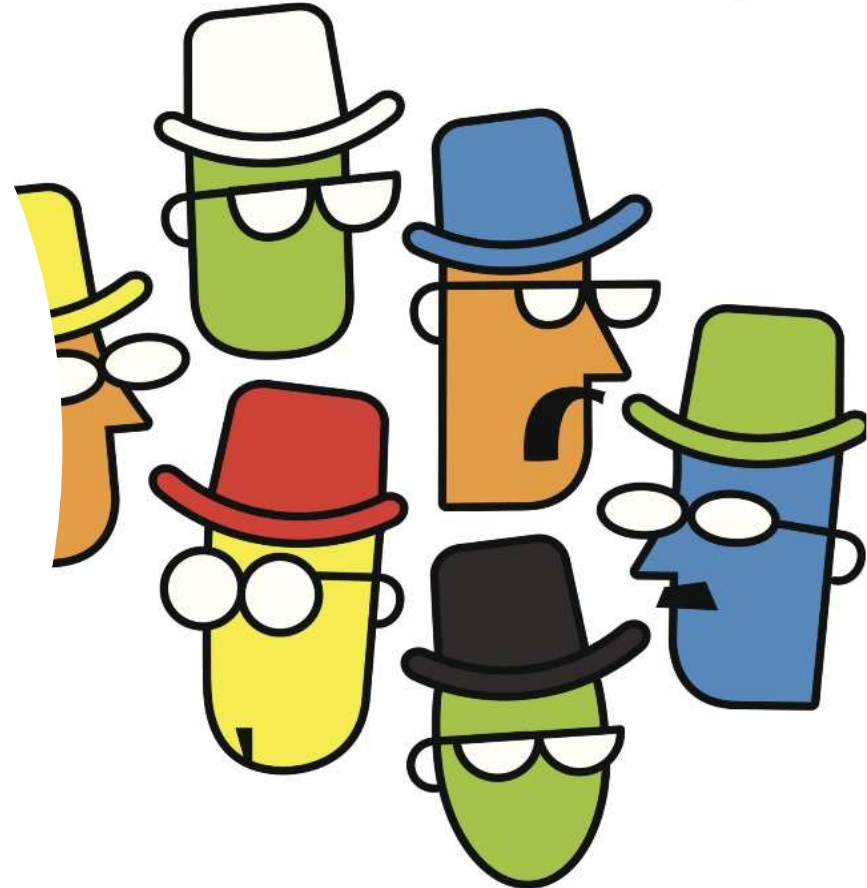

DE BONO'S THINKING HATS

The Six Thinking Hats – Activity

<https://www.proprofs.com/quiz-school/story.php?title=which-thinking-hat-are-you>

What do you think of the outcome you got and why?

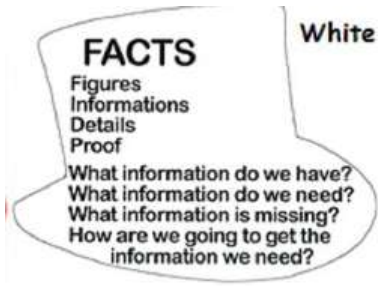

Starting from the Blue Hat – The chair or facilitator

Did anyone come up as a Blue Hat from the Quiz?

What we are going to do?

- White Hat – information about the project aims – 2mins
- Green Hat – Idea generation- - 15mins
- Red Hat – What does your gut tell you? How are you feeling about the ideas? Choose 1 Favourite -10mins
- Black Hat – Caution and Risk – 5 mins
- Yellow Hat – Benefits – 5mins
- White Hat – Have we got all the facts to make a decision whether to pursue the idea? What are we missing? 5mins
- Red Hat – How do you feel now? 2mins
- Blue – summarise, action plan, owners and timelines

The White Hat – Information and Facts

Alternative story:

Jack, a poor country boy, trades the family cow for a handful of magic beans, which grow into a massive, towering beanstalk reaching up into the clouds.

Jack climbs the beanstalk and finds himself in the castle of an unfriendly giant. The giant senses Jack's presence and wants to 'grind his bones to make his bread'.

Jack discovers that the Giant is a great source of income for the village (he had been stealing things from the reach kings and has a lot of riches.)

Rather than cutting the beanstalk down and make the giant fall down, Jack wants to be able to reach the Giant's realm in the sky every time he needs to without disturbing the giant.

Design a new way for Jack to be able to do that

Green hat - Idea Generation

- 1 minute – silent work – think of as many ideas as you can to solve Jack's problem
- 3 minutes – write your ideas down – 1 idea per post it notes
- Once done
- Share only 1 idea with the group – the one you think is best
- Place your post it with the one idea on the board/table
- Any other ideas that you think are not present on the table but should be ?

Red Hat – what is your gut telling you?

- Take 3 sticker dots and place them on your favourite idea
- Let's see which ideas got the most votes
- Let's group the ideas into main themes
- How do you feel about the main ideas? What would be the impact of those ideas on how Jack, the villages and the giant feel? Is this the right thing to do? Do the ideas align with our values?
- **Choose one idea to analyse**

What can go wrong?

- Short and Long Term implications
- Risks
- Errors in rationale / logics
- Resources
- Trouble shooting

Why is this a good idea?

- Benefits?
- How can we make this work?
- How can we mitigate the risks?

Back to the white hat — decision time

Is this idea worth exploring?

What facts, evidence do we have to be able to make a decision?

Accepted?

Rejected? – If rejected go back to the next idea that received the most votes and start again...

Back to the blue hat – what's next?

- Summary
- Action Plan:
 - 1 What does success look like, how do you know the objective is achieved :
 - 2. What foundations need to be put in place for the success to happen
 - 3. 1-3 Main foundations – what needs to be done to get there – practical
 - 3. Main 2-3 risk/challenges/obstacles and how to overcome them
 - 4. Resource, owners and support
 - 5. Realistic Timeline
 - Who is doing what and by when?
